

HEADWEAR WITH ARTICLE SECURING APERTURE

5

Abstract of the Disclosure

A headwear is provided to secure a longitudinally extending article, such as a golf tee. The headwear includes a crown adapted to substantially conform to a wearer's head, the crown formed from at least one substantially planar panel having opposing interior and exterior surfaces. An aperture extends through the panel from the interior surface to the exterior surface. The article is inserted through the aperture so that a proximal end of the article is contactingly supported adjacent to the exterior surface of the panel and a medial portion of the article extends adjacent to and substantially parallel with the interior surface of the panel. In some embodiments, the article is inserted into a gap between the panel and an interior headband. In other embodiments, a distal end of the article projects through a second aperture to the exterior surface of the panel.
